

# Checklist

## Is Your Infrastructure Built for Zero Trust and Real-Time Visibility?

Today's threat landscape demands more than firewalls and patching. Security-conscious IT leaders are shifting toward Zero Trust models and real-time observability to prevent, detect, and respond to threats faster. This checklist is ideal for infrastructure or security teams managing hybrid environments or supporting **500+** endpoints.

### How do you know your foundation is secure?

Use this checklist to quickly evaluate whether your foundation is secure, visible, and ready to adapt.

- Do you require MFA and SSO for all users, across all systems?

---

- Are access privileges reviewed regularly and assigned by role?

---

- Can you monitor devices for health and compliance before granting access?

---

- Is endpoint protection (encryption, antivirus, etc.) centrally managed?

---

- Do you have tools for real-time monitoring and behavioral anomaly detection?

---

- Are your systems segmented to prevent lateral movement in case of breach?

---

- Can you enforce consistent policies across cloud, hybrid, and on-prem environments?

### How to Use This

Share it with your security architect or run through it as a self-audit ahead of your next infrastructure review. It's a quick, strategic gut check.

#### Scoring Tip:

**6-7 CHECKS**

Strong foundation, maintain and monitor

**3-5 CHECKS**

Some risk, consider roadmap updates

**0-2 CHECKS**

High exposure, time for a deeper review
